

EKZA

Create once. Verify rights. **Activate across games.**

EKZA is building the rights and delivery rail for AI-born game assets. Cardano records origin, permissions and payouts; EKZA delivers an approved rendition to each game.

● Existing technical proof

● AI-native game-content rights rail

● Cardano-first build milestone

● by Wotori Studio

ekza.io

AI makes content supply explode. Shipping still scales **one title at a time.**

Creation is already AI-assisted. Production-ready assets still need specialist work, target-engine setup, rights approval and partner QA – then repeat for the next title.

AI lowers the cost of generation. It does not remove production, rights or per-title integration.

Cross-game does not mean one file fits every game.

Art direction, skeletons, animation systems, polygon budgets, materials and gameplay rules differ. A portable asset needs one verified identity plus an approved rendition for every game.

Cardano keeps identity, rights and approvals common. EKZA produces the version each partner can actually ship.

Cross-company portability needs a neutral rights record.

A Cardano-native identity links source hashes, permissions, contributor shares and rendition approvals. The 3D files stay off-chain; the verified passport travels between companies.

“One verified identity.
Multiple approved renditions.”

THE CARDANO-NATIVE EKZA PASSPORT

Cardano maps cleanly to the product — not just the pitch.

Native assets anchor identity, CIP-68 supports an evolving passport, Aiken governs updates, and wallet standards make self-custody an optional claim rather than forced onboarding.

Aiken policy – mint, update, approval and payout-split validation: a settlement transaction is valid only when its outputs match the passport's recorded shares.

Players stay account-first; ownership becomes portable.

A normal EKZA account shows supported games and the correct rendition. Users who want self-custody can connect a Cardano wallet and prove control through a signed claim.

Five product layers turn AI output into enterprise-ready digital IP.

EKZA unifies creation, rights, a Cardano passport, partner delivery and settlement.
The asset record persists while models, files and game engines evolve.

P1	AI Creation Studio	Guided image + 3D workflow with source history
P2	Rights & Player Profile	Accounts, inventory, claims and compatible games
P3	Cardano Asset Passport	CIP-68 hashes, permissions, versions and approvals
P4	Partner SDK & Indexer	Entitlement read and game-specific delivery
P5	Production & Settlement	Adaptation, QA, licenses and contributor payouts

Moat: requirements, rendition history, rights schemas, adapters and QA baselines compound with every partner.

The asset model already works. Cardano is the next implementation.

Four open-source Solana devnet programs prove the asset graph, ownership, identity and minting patterns. Arena and Omoba provide controlled contexts; Apex turns that proof into a Cardano-native milestone.

Stellar • EKZA module

Collaborative asset graph, lineage and contributor shares.

• Solana devnet

Space

Ownership and configurable entitlement primitives.

• Solana devnet

Avatars + Minter

Portable identity and asset-minting primitives.

• 2 Solana programs

Ekza Arena + Omoba

4 live devnet universes, 100 addressable content records and 200+ Arena-stack tests.

• integration proof

Ten weeks to a Cardano-native proof investors can verify.

The program converts working cross-chain primitives into a Cardano preprod passport, product integration and commercial evidence.

- ♦ **Weeks 1-2** – eUTXO design, Aiken policy and CIP-68 schema.
- ♦ **Weeks 3-5** – issue, update and index the passport on preprod.
- ♦ **Weeks 6-8** – wallet claim plus controlled game entitlement.
- ♦ **Weeks 9-10** – settlement demo, partner pipeline and Demo Day.

target: one native asset → one evolving passport → two approved renditions

Ten-week program → four independently checkable outputs

Demo Day verification kit		TARGET OUTPUT
01	Explorer transaction link native asset issue + passport update on Cardano preprod	
02	CIP-68 datum diff source hash · permissions · version · partner approval	
03	Two entitlement logs controlled EKZA runtime + external partner environment	
04	Reproducible tests Aiken policy · indexer · SDK fixtures · public verification guide	

One Cardano passport. Two live game environments.

The first pilot links one master to two approved renditions, then validates entitlement in a controlled EKZA runtime and one external partner environment.

1

Master + rights brief

Recognizable identity, source history, contributors and explicit commercial scope.

1

Cardano passport

Native asset, CIP-68 record, issue / update policy and transaction evidence.

2

Game environments

Partner-approved renditions and entitlement checks in EKZA plus one external title.

Technical success: the same asset identity resolves to the right approved package in both runtimes.

Commercial success: partner acceptance plus a priced repeat decision.

Paid integrations create the network before consumer scale.

EKZA starts with Cardano games, IP owners and creator platforms that need verifiable rights plus production-ready 3D delivery. Each paid build creates reusable infrastructure.

\$20–30k

LAND · PAID TITLE POC

Asset, passport, approved rendition, adapter and partner QA.

\$10–15k

RECUR · ANNUAL TITLE FEE

Profile, indexer, SDK, delivery and version management.

10%

FLOW · TARGET TAKE

EKZA-enabled licensing and contributor settlement.

N×

EXPAND · NETWORK

More assets, approved renditions and games per passport.

Cardano beachhead

Games, IP owners and creator platforms reached through ecosystem and Draper introductions.

Open schema + SDK

Replication path beyond one studio and one integration team.

Service-led entry, platform-led scale. The first integration pays for the adapter; every reuse shifts revenue toward software and licensed flow.

The endgame is a rights rail for every AI-born game asset.

Characters are the wedge. The same passport and delivery system expands to props, environments and branded IP across engines, marketplaces and games.

SCALE

Licensed-content settlement rail

Alternatives win one layer. EKZA connects **rights to runtime**.

PRODUCT	PRIMARY STRENGTH	RIGHTS / SETTLEMENT	GAME DELIVERY	CHAIN
Meshy	AI 3D generation	Not in public scope	Files + plugins / API	Off-chain
Avaturn	Rigged avatar system	No Cardano rail	Standard avatar + SDK	Off-chain
Story	Programmable IP	PIL + royalty graph	No 3D production layer	Story L1
NMKR Studio	Minting + checkout	Metadata + royalty tools	No rendition / QA	Cardano
EKZA — target	Rights-to-runtime	CIP-68 + splits	Approved rendition + SDK	Cardano

EKZA sits above generation and token tooling: the differentiator is partner-approved adaptation plus runtime entitlement.

Ready Player Me is a historical benchmark; services ended 31 Jan 2026.

The founder builds full-time; scoped specialists multiply throughput.

Dmitrii remains the daily code owner throughout the residency. Cardano reviews and partner meetings turn into same-week product releases.

Dmitrii Sobolev (aka Wotori)

FOUNDER · CREATIVE TECHNOLOGIST

- 15 years · 3D, animation & game technology
- 7 years · commercial software development
- Master of Computer Science · USTB Beijing, 2024
- Master of Design · HSE, 2019
- HackAtom VI · 2nd place

RESIDENCY OPERATING MODEL

Dmitrii onsite, full time: owns CIP-68 / Aiken architecture, indexer, SDK, security gates and releases. The residency is build time – not time away from the builder.

PARALLEL DELIVERY PACKAGES

- | | |
|--|---|
| + 3D rendition + target-game adapter | + Indexer / frontend QA + automated tests |
| + Scoped Aiken / eUTXO review via Apex | + Founder review → merge → weekly demo |

Co-build proof: 70 public Wotori commits inside Xyber Labs' multi-contributor 0→100 Solana protocol.

Use Apex to make Cardano the production rights rail.

● WORKING NOW · VERIFIED

Validated asset model

Four Solana devnet programs plus controlled game contexts

WEEKS 1–5 · BUILD

Cardano preprod

CIP-68 passport, Aiken policies, indexer and test evidence

WEEKS 6–10 · VALIDATE
